PACOS — Actions, What They Open, and What They Do

The onboarding reference. For every clickable thing: **what it opens or triggers**, and its **implication** — does it write, cost tokens, hit the network, delete, or send? This is what the tutorial narrates as it clicks, and what the in-app tooltips should say.

Implication legend

Tag	Meaning
🟢	Read-only / navigation — safe, changes nothing
🟡	Writes local state — reversible (edit/regenerate/delete later)
🔵	Makes a model call — costs tokens / needs an API key (Dry-run avoids this)
↗	Opens a third-party site in a new tab (LinkedIn, Google, Gmail)
🔴	Destructive — removes data
🔒	**Never auto-sends** — a human does the actual sending, always

The golden rule, stated once and true everywhere: **PACOS drafts and tracks; you send.**

The deck's full golden rules (How-To slides 2 & 15) — the promises every 🔒/🟡 action keeps:

1. **PACOS never sends** — no send path exists in the code.
2. **Extractors only propose** — JD parser & Chat write nothing until you confirm.
3. **Always read an asset before sending it.**
4. **The inbox monitor is read-only** (`gmail.readonly`).
5. **`tracker.db` is the source of truth**; `tracker.csv` is an export.
6. **Dry-run first** — no tokens.

Sidebar (always visible)

The nav is a linear pipeline, left to right in intended order.

Click	Opens	Implication
Dashboard / Leads / Assets / Approvals / Tracker / Chat / Discovery	That page	🟢
Footer "never auto-sends"	(label only)	🟢 — the trust anchor; keep it on screen

---

Dashboard — the control room

Action	What happens	Implication
Stat cards (Leads, With assets, Follow-ups due, Interested, Interviews)	Live counts of your pipeline	🟢
Generate with Nemotron	Runs the generation pipeline for every lead **missing** assets: one personalization pass + four asset agents per lead	🔵🟡🔒 — real model calls; writes four assets per lead; nothing is sent
Dry-run (templates)	Same pipeline, but produces placeholder templates with **no API key and no tokens**	🟡 — safe way to see the flow / demo it
Review hooks (checkbox)	Auto-approves the personalization "hook" per lead during generation	🟡
Agent status board	Live per-agent state (queued → done) as a run progresses	🟢

> Implication to narrate: "Generate only builds leads that don't have assets yet — so adding one lead and clicking here builds *that* lead, not all 429."

Leads — the roster

Action	What happens	Implication
+ Add lead from JD	Opens a paste box; an *extractor* reads the job description and **proposes** fields	🔵 — proposal only; nothing is written until you confirm
+ Add lead manually	Opens a form for one lead	🟡 on submit — writes to lead sheet + tracker
Search / Domain / All-leads filters	Filters the visible rows	🟢 — client-side only
Row click	Opens that lead's **Assets** page (`/assets/:id`)	🟢
profile ↗	Opens the lead's LinkedIn profile in a new tab	↗
Find people (row)	Jumps to **Discovery**, pre-filled with that lead's company/role/city	🟢
Remove (two-click confirm)	Deletes the lead from the tracker, the lead sheet, and its generated assets	🔴 — scoped to one lead; two clicks required on purpose
Predicted Email + confidence chip	Shows the guessed email and how sure PACOS is	🟢 — *predicted, never verified*

Discovery — find the humans behind a job

Action	What happens	Implication
Company / Role / City / Keywords	Inputs that seed the search	🟢
Build searches	Generates 7 Boolean **search variants** (hiring managers, leads, recruiters, TA, HRBPs, broad)	🟢 — deterministic; writes nothing
LinkedIn search (per card)	Opens LinkedIn people-search pre-filled with the query	↗
Google X-Ray (per card)	Opens a Google `site:linkedin.com/in` search	↗
Copy query	Copies the Boolean string to your clipboard	🟢
Find People ⭐	Runs the X-Ray, extracts profiles, predicts emails, and **creates leads**	🟡🔒 — writes leads with predicted emails; still human-reviewed, nothing sent
Paste results instead → Import from pasted results	Same import, from a Google results page you paste (used when Google blocks the auto-fetch)	🟡 — the source stays your own Google query, no paid API

> "Find People" is the one genuinely new capability — it replaces manual copy-paste from search results. Everything it makes is a normal lead you can edit or remove.

Assets — the four drafts per lead

Action	What happens	Implication
Search leads / dropdown	Picks which lead's assets to view	🟢
Cold Email / Cold DM / Cover Letter / CV Notes tabs	Switches the shown draft	🟢
Regenerate	Rewrites **that one** asset via a fresh model call	🔵🟡
Copy	Copies the draft to your clipboard (to paste into email/LinkedIn yourself)	🟢🔒
"(not generated — lead has no email…)"	The conditional skip: no email on file ⇒ no cold email, DM only	🟢 — expected behavior, not an error

---

Approvals — human-in-the-loop

Action	What happens	Implication
Ready to send → Mark sent as (DM / Email / Both)	Records that **you** sent it; sets status = sent and a follow-up date	🟡 🔒 — you send by hand first, then log it here
Awaiting reply → intent (interested / rejected / follow-up)	Records the reply outcome	🟡
Unmatched replies → pick lead → Link	Attaches an inbox reply the monitor couldn't match to the right lead	🟡

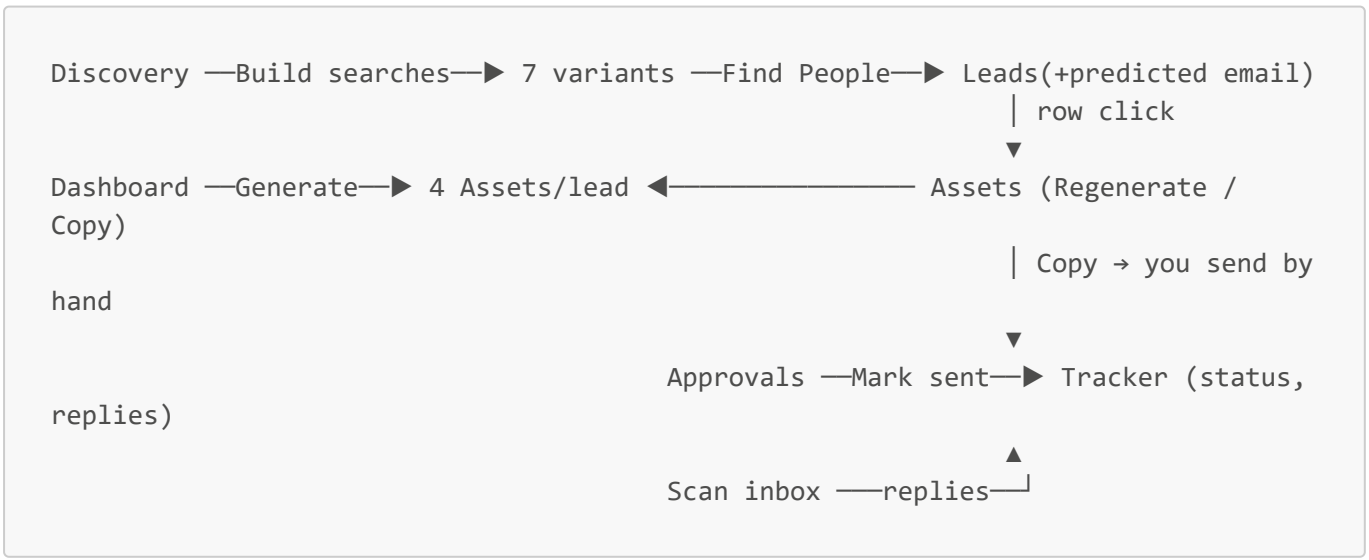

Tracker — the whole pipeline

Action	What happens	Implication
Scan inbox	One-shot Gmail read: classifies replies, collects job alerts (needs one-time OAuth)	↗🟡 — reads mail; writes classifications; never sends
Search / status filter	Filters rows	🟢
Set status dropdown (per row)	Moves a lead's pipeline status	🟡

Chat — describe a person or paste a JD

Action	What happens	Implication
Message box + **Send**	The assistant answers and may **propose** a lead from what you describe	🔵 — proposal only; you confirm before it's written

The one-glance interaction map (for a diagram card in the video)

Every arrow that changes data is 🟡; the only 🔴 is **Remove**; there is **no arrow that sends** — that step is always you.
