

LV.0 → LV.1 · AI ENGINEER

The 6 E's that move you from **Level 0** → **1** AI engineer.

Ensemble, Entropy, Encoder-Decoder and more. **Plain-English** definitions, one swipe each, plus a researcher worth following.

EUCLIDEAN DISTANCE • FOUNDATIONS

Euclidean Distance

straight • line • distance

Euclidean distance is the **straight-line distance between two points**, computed with the Pythagorean theorem. In machine learning it measures how similar two data points or vectors are, powering algorithms such as K-Nearest Neighbors, K-Means clustering, and similarity search over embeddings.

USED IN

- KNN
- K-Means
- Similarity search

DISTANCE BETWEEN VECTORS

INFORMATION ENTROPY • FOUNDATIONS

Entropy

measure • of • uncertainty

Entropy is a measure of uncertainty, randomness, or impurity in a dataset. In machine learning it quantifies **how mixed the class labels are** and is used in decision trees to choose the best feature for splitting data, with lower entropy meaning more homogeneous, informative partitions.

USED IN

- Decision trees
- Information gain
- Feature splitting

LOW VS HIGH ENTROPY

ENSEMBLE LEARNING • LEARNING

Ensemble

many • models • one vote

Ensemble learning is a technique that **combines the predictions of multiple models** to produce a more accurate, robust result than any single model. By leveraging diverse learners through bagging, boosting, and stacking, ensembles improve performance, reduce overfitting, and enhance generalization.

USED IN

- Bagging
- Boosting
- Random Forest

COMBINE MANY LEARNERS

Encoder-Decoder

encode • compress • decode

An encoder-decoder architecture is a framework where **an encoder compresses input into a representation and a decoder turns it into output**. Widely used in machine translation, summarization, image captioning, and multimodal AI, it underpins models such as T5 and many sequence-to-sequence systems.

USED IN

- Translation
- Summarization
- Seq2seq

ENCODE → DECODE

Evaluation Metrics

measure • compare • ship

Evaluation metrics are the **quantitative measures used to judge how well a model performs**. Classic ML uses accuracy, precision, recall, F1, and ROC-AUC, while GenAI adds faithfulness, answer relevance, groundedness, and LLM-as-judge scores, plus frameworks like RAGAS for evaluating retrieval and generation.

USED IN

- Accuracy & F1
- Faithfulness
- LLM-as-judge

FAMILIES OF METRICS

ENCRYPTION • SECURITY

Encryption

encode • protect • decode

Encryption is the process of **converting readable data into an encoded format** using cryptographic algorithms and keys, so only authorized parties can access the original information. It is a fundamental pillar of cybersecurity, protecting sensitive data during storage, transmission, and communication across digital systems.

USED IN

- Cybersecurity
- Data privacy
- TLS

PLAINTEXT → CIPHERTEXT

HIGH-SIGNAL, LOW-NOISE

Edward Hu

AI researcher • LoRA, muP

Edward Hu is an AI researcher best known for **inventing LoRA, the low-rank adaptation method** that made fine-tuning large language models cheap and practical. His work on parameter-efficient training and muP scaling shapes how modern models are adapted and tuned across the industry.
